

Project ideation document

The project is going to be made for an electronic store.

The store has 2 types of products, laptops and phones. Printers can also be added to the project.

The purpose of this project is to deliver both web applications and desktop application that both have different objectives.

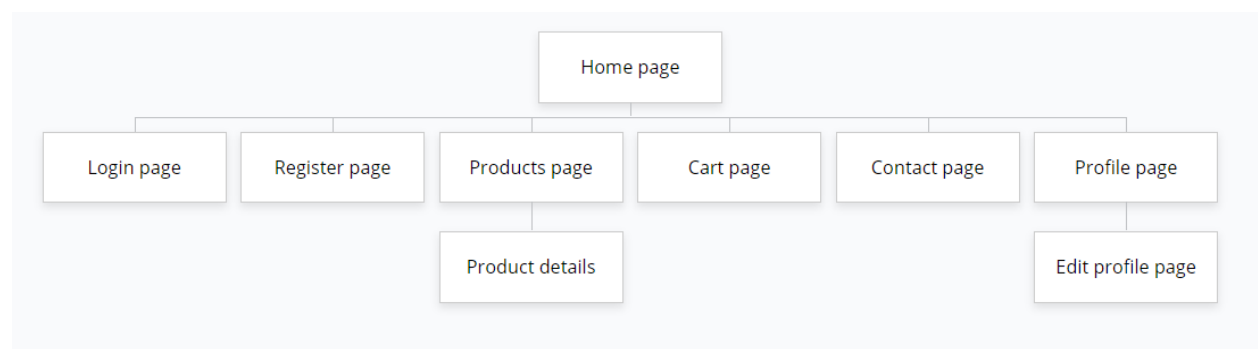

The desktop application will be mainly used for Creating, Reading, Updating, and Deleting products and users. There will be different users like admins and managers meaning that there will be management for each type of product. Users will be able to login and logout. Admins will be able to add, edit, view and delete managers. Managers will be able to manage their own products.

Features like statistics and/or discounts may also be added into this project.

For the web application is going to be used for creating, reading, updating and deleting users. What I mean by this is that users will be able to make accounts, login, edit and/or delete. They would also be able to purchase products from the website. They will also be able to favorite an item and save it in their own favorite list. Some features that will be added are related products, search and product filtering.
